### Purpose/Description:

Paid time off is a huge incentive for employees at Northwest Christian Childcare (<http://www.northwestchristianchildcare.org/>) to come to work on time every day and work all the hours the employee is scheduled. At Northwest Christian Childcare there are issues where people are earning paid time off when they shouldn't because the system is monitored by people who are not following the rules. The way the incentive system works is that for each time an employee works the full pay cycle, the employee earns a specific amount of paid time off. Instead of having someone keep track of this and make decisions based off a spread sheet, the PTO calculator program takes over this responsibility. The way it does this is by taking in the spread sheet as a data file and breaking down information by employee. Then, it calculates whether the employee should receive paid time off and what to do if the employee is not hitting compliance hours. The program is versatile because it has options to look at in depth information based on a single employee, or calculate all the employees' PTO for the pay cycle in one "run" of the program. It is completely function based and easy to use, read, and change based on the situation.

Input: Spread sheet of employee data

Main Outputs: Employee, Straight Hours, Overtime Hours, Total Hours, Hours Scheduled, Warning, PTO Calculation, PTO Bank Status. (There are other mini inputs inside of the functions that are called, but they are irrelevant to the user).

### Overview/Functions:

1. exec\_function\_project\_rosaton
  - a. Compiler function in this program; connects all functions together. This is the only function that should be ran in the code.
    - i. Inputs: z
    - ii. Outputs: Start, Warnings, Employee\_Number
2. employee\_PTO\_Bank\_rosaton
  - a. This is the function that allows the user to adjust the code if the employee has saved up PTO from prior weeks. It is primarily used to calculate the new amount of PTO based on if the employee follows compliance.
    - i. Inputs: Employee, Employee\_Number, e\_data, Warnings
    - ii. Outputs: PTO\_Bank, PTO, New\_Employee, Ability
3. employee\_PTO\_calculator\_rosaton
  - a. This function calculates if a specific employee gets paid time off by meeting a set of specific criteria from Northwest Christian Childcare.
    - i. Inputs: Employee, PTO\_Bank, New\_Employee, Ability, Warnings
    - ii. Outputs: PTO
4. employee\_reference\_rosaton
  - a. This is a function breaks down the matrix of the numbers from the spread sheet in to employee vectors for the first group of employees in the spread sheet.

- i. Inputs: Employee\_Number, e\_data
  - ii. Outputs: Employee
- 5. employee\_reference\_rosaton\_2
  - a. This is a function breaks down the matrix of the numbers from the spread sheet in to employee vectors for the first group of employees in the spread sheet.
    - i. Inputs: Employee\_Number, e\_data
    - ii. Outputs: Employee
- 6. employee\_reference\_rosaton\_3
  - a. This is a function breaks down the matrix of the numbers from the spread sheet in to employee vectors for the first group of employees in the spread sheet.
    - i. Inputs: Employee\_Number,e\_data
    - ii. Outputs: Employee
- 7. imbedded\_rosaton
  - a. This is used for the starting function allowing the user to input words as the preferences, makes the program more accessible to people who are not as familiar to MATLAB.
    - i. Inputs:
    - ii. Outputs: All, One, Introduction
- 8. n\_output\_rosaton
  - a. This is for the “for” loop in the function; determines the n index for the loop.
    - i. Inputs: e\_data
    - ii. Outputs: n
- 9. Starting\_Function\_rosaton
  - a. This is the function that the user changes. Essentially, it is for setting preferences in the program so the program calculates what the user wants to see.
    - i. Inputs: z
    - ii. Outputs: Start, Warnings, Employee\_Number

## Project Requirement Specs:

Table A

Requirement	Function	Line
Reads a file	exec_function_project_rosaton	19,52

Lines of Code not counting comments: 292

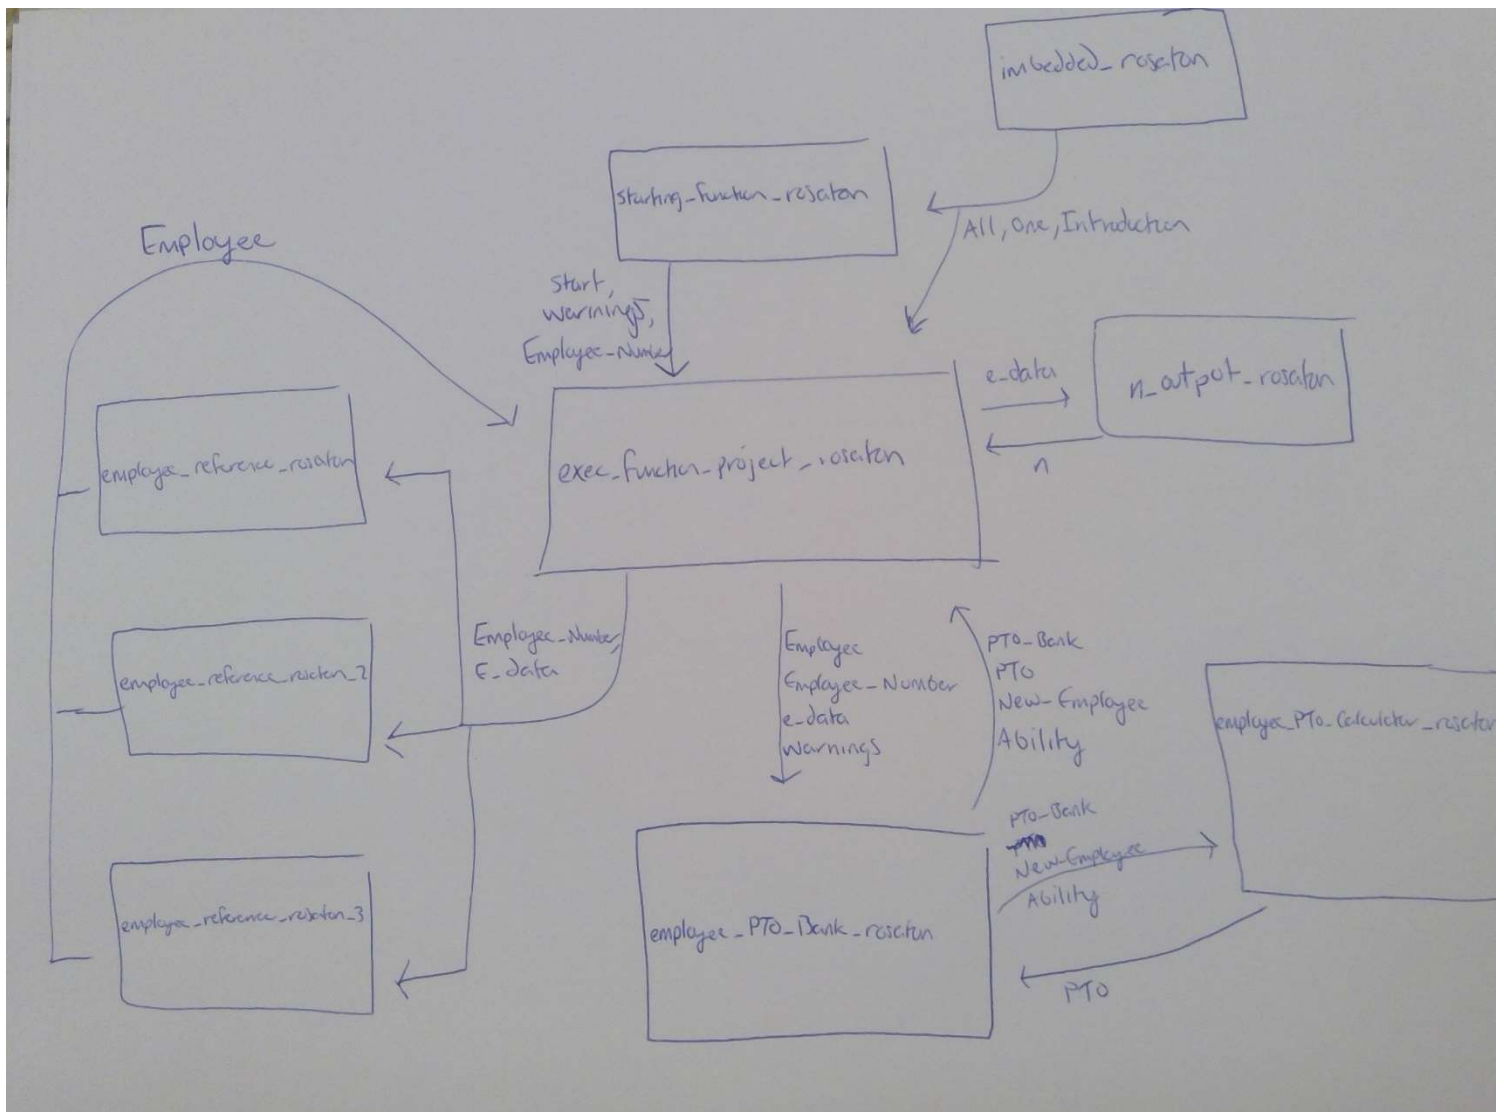

*Note: I used a function called "sloc" to count my lines of code in my functions, I got it online. Link to the code share: <https://www.mathworks.com/matlabcentral/fileexchange/3900-sloc>.*

Comments: See code

*Note: The lines provided in Table A are not the only instances where the required MATLAB functions are used. Reference the code prints at the bottom of this report if you want to see more instances of the required functions.*

## Function Diagram:

Diagram B

### User Manual:

Welcome to the PTO Calculator! This user guide will provide you with the tools to successfully evaluate paid time off for employees along with the analysis of employee compliance status. The program is designed for the user to set preferences in one function, nothing should be inputted through the command window. Please follow the steps below to successfully be able to run the program.

#### 1. Initialization of program functions

You will want to initialize all 9 of the program's functions to begin. The functions are listed below.

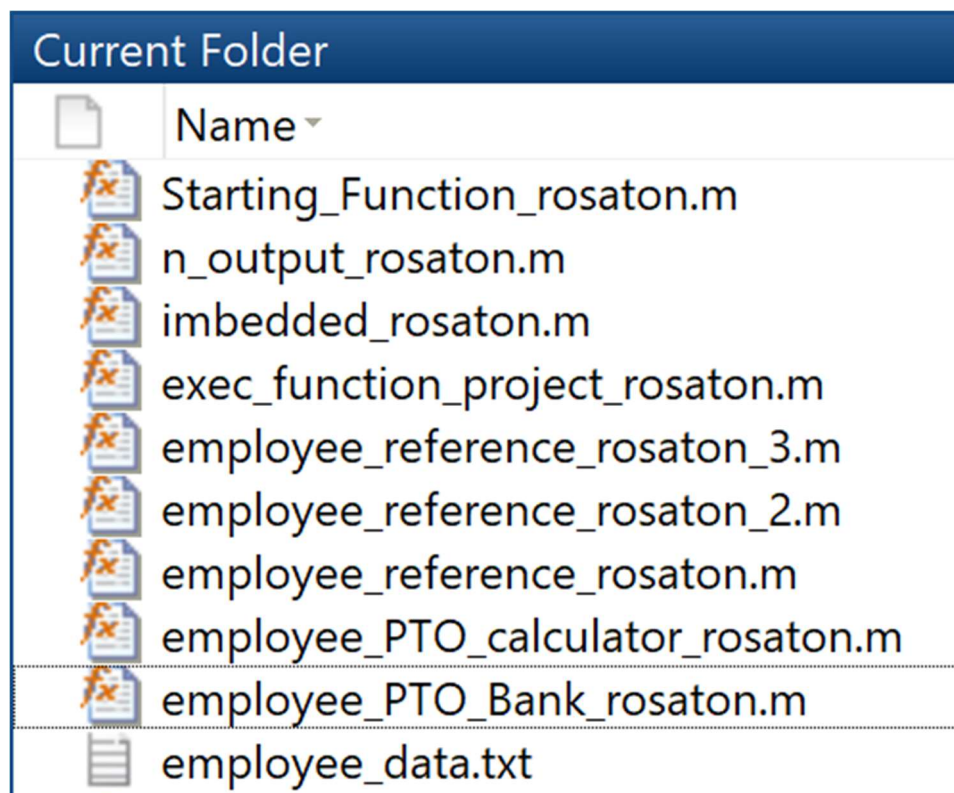

1. *exec\_function\_project\_rosaton*
2. *employee\_PTO\_Bank\_rosaton*
3. *employee\_PTO\_calculator\_rosaton*
4. *employee\_reference\_rosaton*
5. *employee\_reference\_rosaton\_2*
6. *employee\_reference\_rosaton\_3*
7. *imbedded\_rosaton*
8. *n\_output\_rosaton*
9. *Starting\_Function\_rosaton*

#### 2. Initialization of the employee data

You will want to upload the .txt file provided into the current folder with the functions on MATLAB. The file is called employee\_data.txt. This file is designed to change based on the pay cycle. A new file is uploaded every pay cycle.

Your Current file should look like this:

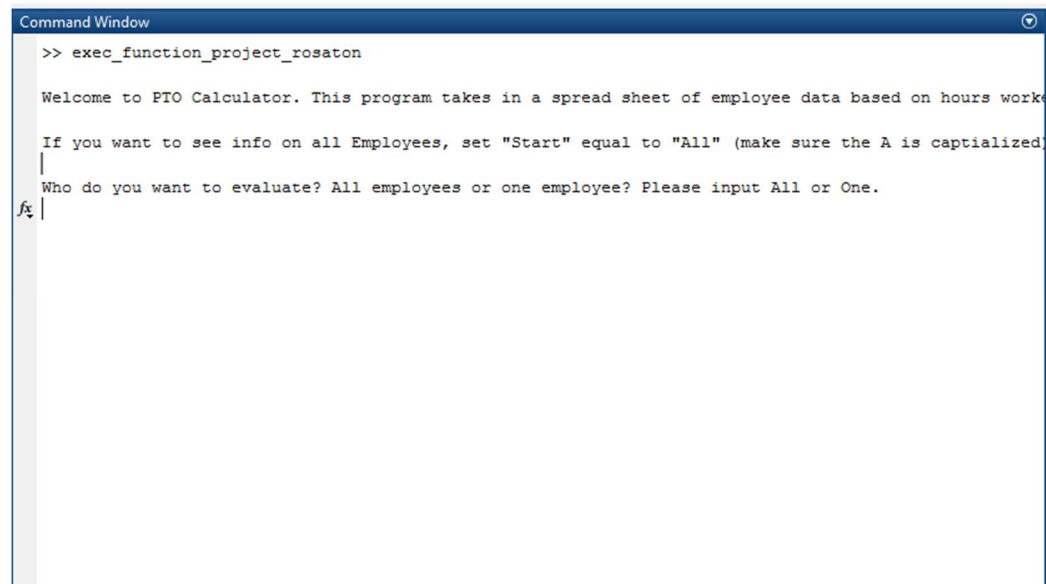

Picture C

### 3. Running the Program

The program will start out in introduction mode. Hit run on *exec\_function\_project\_rosaton* to start the program. The output should be a few print statements. It should look this like below:

Picture D

```

Command Window
>> exec_function_project_rosaton

Welcome to PTO Calculator. This program takes in a spread sheet of employee data based on hours worked.

If you want to see info on all Employees, set "Start" equal to "All" (make sure the A is capitalized).

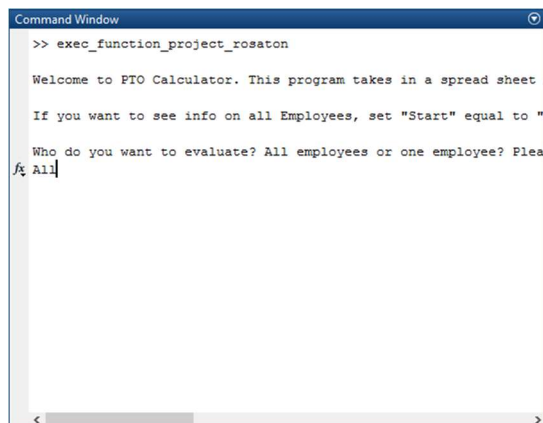

Who do you want to evaluate? All employees or one employee? Please input All or One.
fx |

```

### 4. Now that you have begun the program, you want to set your preferences. You have two options for preferences All or One (employee(s)).

- If you want to look at the data for all employees for PTO earned only, run the executive function and enter "All" in the prompt. Make sure the "A" in "All" is capitalized. The command window will display data on all employees. You will also be able to see data analytics on the set of employees.

Picture E

```

Command Window
>> exec_function_project_rosaton

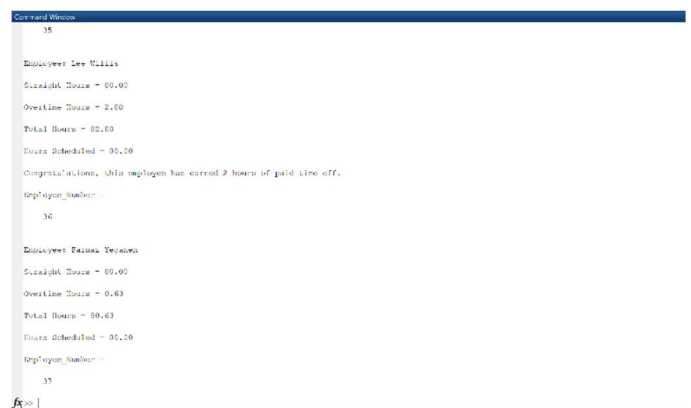

Welcome to PTO Calculator. This program takes in a spread sheet of employee data based on hours worked.

If you want to see info on all Employees, set "Start" equal to "All" (make sure the A is capitalized).

Who do you want to evaluate? All employees or one employee? Please input All or One.
fx All

```

Picture G

```

Command Window
35

Employee: Dev Willis
Straight Hours = 32.00
Overtime Hours = 2.00
Total Hours = 34.00
Hours Scheduled = 35.00
Congratulations, this employee has earned 2 hours of paid time off.

Employee Number:
36

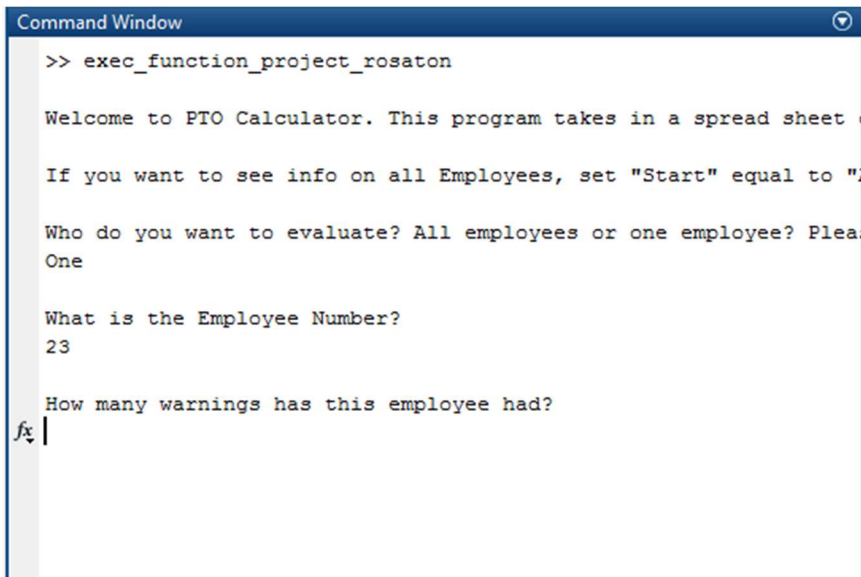

Employee: Emma DeJesus
Straight Hours = 32.00
Overtime Hours = 0.63
Total Hours = 32.63
Hours Scheduled = 35.00
Employee Number:
37
fx

```

- b. If you want to look at the information and compliance data (what to do based on warnings), enter "One" in the prompt in the beginning of the program. Now that you have set your preference to "One" you will have to input "Employee\_Number" and "Warnings" in the prompt. To pick the employee you want to reference, please refer to the spread sheet provided below. The number of warnings is referencing how many warnings the employee has had for not reaching compliance. Please note that the warnings and earned PTO shown in the spread sheet will be empty as it is for a work place to input. Now that the preferences are set the function should run on its own. The command window will display data on one employee when the start function is set correctly. A sample is below shown in Picture H and Picture I:

Picture H

```
Command Window
>> exec_function_project_rosaton

Welcome to PTO Calculator. This program takes in a spread sheet

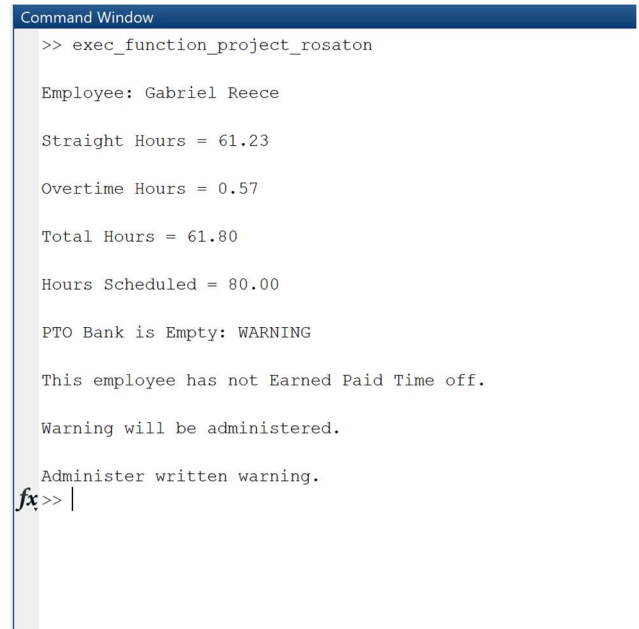

If you want to see info on all Employees, set "Start" equal to "2"

Who do you want to evaluate? All employees or one employee? Please
One

What is the Employee Number?
23

How many warnings has this employee had?
fx |
```

Picture I

```
Command Window
>> exec_function_project_rosaton

Employee: Gabriel Reece

Straight Hours = 61.23

Overtime Hours = 0.57

Total Hours = 61.80

Hours Scheduled = 80.00

PTO Bank is Empty: WARNING

This employee has not Earned Paid Time off.

Warning will be administered.

Administer written warning.
fx>> |
```

### Employee Spreadsheet

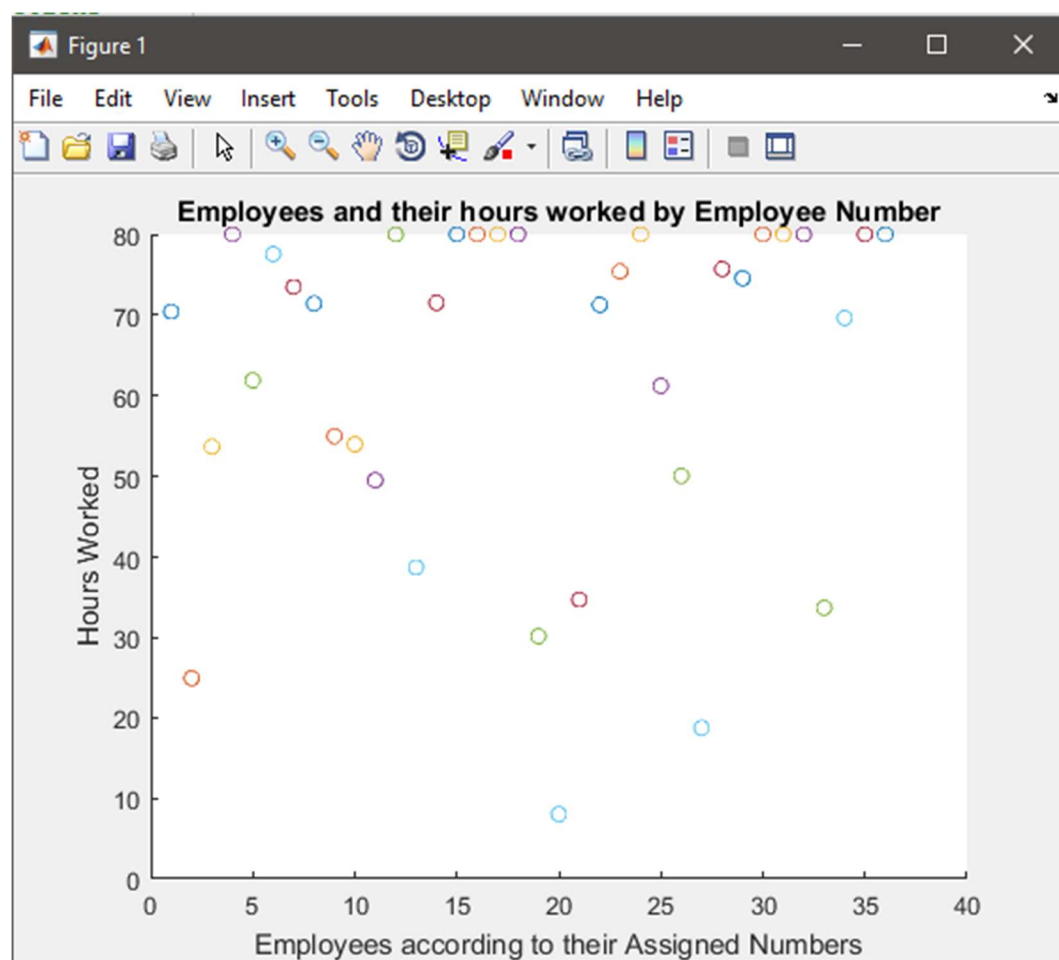

*Note: The Employee Number is to the left of the employee name.*

## Sample of Data Analytics for this Program

Picture K

## DATA ANALYTICS

A graph to display trends among employee hours will also be displayed.

The average amount of hours worked is 62.93 hours

The average amount of overtime worked is 1.38 hours

The number of employees that hit compliance for this pay cycle is 14 employees
